Abstract.

Purpose: The purpose of the study is to investigate the tools/technologies that would be of value to libraries as they implement Knowledge Management (KM) and to map these to different phases of the KM cycle.

Methodology/approach: Models of the KM cycle and theories related to IT adoption were reviewed, along with tools/technologies for collaboration and KM. A theoretical ‘model for KM tools and their adoption in libraries’ was arrived at.

Findings: It was found that there is no single set of tools that would be applicable to everyone or across libraries. Also, technology is just an enabler for KM. Therefore, a comprehensive set of tools, both physical and technological, are presented.

Research/practical Implications: The paper provides a practical, one-stop place for librarians to decide on KM methods and tools based on their unique environments. The proposed model for KM tools should guide further research.
Originality/value: Most studies on KM have been outside libraries. Of all KM tool studies, there is a lack of a single paper that puts together the majority of tools/technologies (whether IT or non-IT based) that would help library staff make informed decisions. The primary research contribution is a model for KM tools and their adoption in libraries.

Keywords. KM tools, technologies, KM cycle, libraries, technology acceptance model, diffusion of innovation

Article classification. Conceptual paper

Background and Introduction

Knowledge management (KM) is a newly emerging approach aimed at addressing today’s business challenges to increase efficiency and efficacy by applying various strategies, techniques and tools in their existing business processes. It has been described as a process or a set of processes (Abell and Oxbrow, 2001; Townley, 2001; White, 2004), a method of management (Shanhong, 2000), a new dimension of strategic information management (Ponelis and Fair-Wessels, 1998), or the use of organizational knowledge through sound practices of information management and organizational learning (Broadbent, 1998). Although the business model of KM is now being adopted by many non-profit organizations such as libraries, it is not as pervasive as in the business sector. In knowledge organizations such as libraries, several kinds of knowledge need to be managed: 1) user knowledge (their need, who to contact, information seeking); 2) resource knowledge (sources and services, where these services are available, and other features of resources) and 3) personnel practice knowledge (expertise available, the quality of service they provide, and others). Moreover, KM can help improve communication among library personnel and between users
and service providers, between top management and staff, and can promote a culture of knowledge sharing (Teng and Hwamdeh, 2002).

The only studies on library and knowledge management have focused on the relationship between KM and library (Sarrafzadeh, Martin and Hazeri, 2010; Roknuzzaman and Umemoto, 2009), the need for KM in libraries (Wen, 2005), KM in academic libraries (Maponya, 2004), librarians’ awareness or perceptions of KM (Siddike and Islam, 2011) and KM in state-of-the-art digital libraries (Islam and Ikeda, 2014). A big hurdle in KM implementation in libraries is a lack of clear knowledge as to how to implement KM. What tools and technologies need to be adopted? What are the set of processes and phases involved? Are the people and processes more important or technology tools and systems? Can we simply implement KM by adopting a particular knowledge management tool or system? Most of the research and case studies of KM implementation, whether in libraries or other business organizations, show that there is no silver bullet to implementing KM (Allee, 1997). Each organization must come up with its own template for what is best suited to its needs. Rather than imposing a process or a tool on an organization, KM is about coming up with strategies, processes and tools that are most likely to be adopted, and used successfully by people in the organization.

**Objective of the study and theoretical considerations**

Without providing a one-size-fits-all solution, this paper is an attempt to help libraries make informed decisions as they venture out to implement KM. We put together the various tools and technologies available for KM implementation, and map them to different phases of the
KM cycle – ranging from knowledge capture or creation, knowledge sharing or dissemination, and knowledge acquisition and application (Dalkir, 2011). These cycles encompass the different ways in which knowledge is managed, from capturing to transferring knowledge (Awad & Ghaziri, 2004).

A few considerations are important as we propose these:

1. A single set of tools for KM cannot be mandated because every library and its employees will need to decide for themselves which tools and technologies they find easy to use and useful to their current needs.
   a. Davis (1989)’s Technology Adoption Model (TAM), which has been tested and validated in countless studies, talks about the importance of two factors – perceived ease of use and perceived usefulness, before people decide to use a piece of technology or not. Thus, the KM tools chosen and adopted must fulfil the criteria of perceived ease of use and perceived usefulness for the majority of librarians and other stakeholders in the library. A number of factors, from prior experience to awareness to familiarity with particular tools may affect both these perceptions.
   b. Different people in the library will take to KM differently. Their attitudes may range from enthusiastic to indifferent to opposed. Roger (1995)’s Diffusion of Innovation theory classifies people into innovators, early adopters, the early majority, the late majority and laggards. Some people will be comfortable changing and adapting to new tools (the innovators and early adopters as per Roger’s theory), while there will be others who will resist and be late to adopt KM (the laggards and the late majority as per Roger’s theory). It is often a good
idea to identify the innovators and early adopters in the library, and bring them into any pilot program for implementing KM in the library.

The TAM model and Roger’s theory provide the theoretical basis for this article.

2. Secondly, technology tools keep changing, so there cannot be a permanent set of recommendations which will hold true across time. What will remain consistent is the need for knowledge creation, sharing and use in libraries.

3. Thirdly, a library needs to factor in the cost of adopting any particular set of tools or technology i.e. buying/licensing, and the cost of maintaining. Even though open source software is considered free, it is not really free, since libraries will need to hire people (computer programmers, or others) who can maintain the software, extend it, write short scripts, etc.

4. Lastly, but most importantly, technology is not the most important in KM implementation. Various studies have noted that KM is about people and not about tools or technology (Rah, Gul and Wani, 2009). Technology is needed to support people’s needs, and not the other way round. If KM and people are the horse, technology is the cart. We have to be careful that the cart does not pull the horse. Technology should act as support for the processes, policies and procedures adapted to best serve people in the organization/library in order to meet the mission and goals of the library. Ruggles (1997b) defines tools as “technologies which support the performance of activities or actions”. He defines KM tools as "technologies ... which enhance and enable knowledge generation, codification, and transfer." In line with the discussion above, Ruggles cautions that “not all knowledge tools are computer-
Based, as paper and pen can certainly be utilized to generate, codify and transfer knowledge."

Keeping these in view, this article does not recommend any one particular approach, tool or a set of tools for KM implementation in libraries. Rather, we bring together various tools, technologies and options currently available that would be useful for different phases of the KM cycle, should a library decide to implement KM. These include both traditional KM tools and (information) technologies as well as open source and Web 2.0 tools. Individual libraries can then pick tools from within those that they think are easy to use, and that their employees are likely to adopt. So, depending on the technology infrastructure in the organization, the expertise of the staff, the relationships with vendors, etc., and the KM needs, the library can decide on the best approach for tools and technologies.

The mapping of the tools/technologies to phases of the KM cycle is important to ensure that technology is not the primary driver, and that technology does not drive the KM phases. Depending on the KM phase being implemented in the library and the unique library context, it can pick the right tools and technologies from a suite of options. While a few prior studies have looked at KM tools (Rollet, 2003; Tiwana, 2002; Tyndale, 2002; ; Jantz, 2001; Dieng and Corby, 1998; Ruggles, 1997), they are not written from the perspectives of Library and Information Science professionals, and do not always map to phases of the KM cycle. The only attempt at a preliminary mapping was by Tyndale (2002). Also, many of the papers were written a long time ago, and a lot of technological developments have happened in the last decade, and continue to happen.
A conceptual/theoretical research approach is adopted in this study. By having the possibilities of KM tools and technologies currently available, and having them mapped to phases of the KM cycle, we hope libraries will be in a better position to make the choices required when implementing KM. This paper is a step in that direction.

The rest of the paper is organized as follows: In the next section, we review the literature. We talk about prior studies on KM tools, the KM cycle and KM cycle models. The integrated model by Dalkir (2011), as well as theories by Davis (1989) and Rogers (1995) are adapted as lens in the study. This is followed by a brief methodology section. We then talk about the tools and technologies for KM implementation and map them to different phases of the KM cycle. This is followed by findings and discussion. Finally, we look at the limitations and future work, and conclude the paper.

**Literature review**

A number of researchers have looked at KM tools in the context of knowledge management. Tyndale (2002) classifies technology tools in 17 areas - intranets, push technologies, etc. He classifies the tools as new versus old, and maps them to knowledge creation, organization, distribution and application. Ruggles (1997, 1997b) classifies KM technologies, focusing on KM uses such as enhancing and enabling knowledge generation, coding knowledge, and transferring knowledge. Rao (2005) compiles case studies of KM tools, techniques and strategies used across organizations. Rollet (2003) classifies technologies in the areas of communication, collaboration, content creation, content management, adaptation, eLearning, personal tools, artificial intelligence, networking, standards and hardware. He
also makes a case for what can, and what cannot, be achieved through technology. Janz (2001) discusses a tool called common knowledge database (CKDB) for managing and using informal knowledge in university libraries. Dieng and Corby (1998) provide an approach to understanding the core tools and techniques widely used in undertaking KM in an organization. Tiwana (2002) includes technologies and KM best practices of KM. Lindvall, Rus and Sinha (2002) survey the tools available to support different KM activities.

The above-mentioned studies have a few important weaknesses: 1) they were written a few years ago. Considering the fast pace of change in technology, and the recent advent of social networking and Web 2.0 tools, many of the tools are not comprehensive or applicable anymore; 2) the terms used to classify tools, e.g. in Tyndale (2002), are broad and use terms from the software industry, and not easily understandable by libraries; 3) Studies such as Rao (2005) include case studies from businesses/industry, and are not directly applicable to libraries; 4) Finally, many of the tools are not comprehensively mapped to phase of the KM cycle even though, some of them such as Tyndale (2002) and Ruggles (1997, 1997b) attempt to do so.

**KM cycle and models**

While libraries have traditionally managed knowledge created by others, KM is about managing knowledge that originates within the library (Townley, 2001). KM can be seen as a cycle that encompasses various phases, such as the capture, creation, codification, sharing, access, application, and reuse of knowledge within and between libraries. Dalkir (2011) reviews KM cycles identified by different researchers, implemented and validated in real
world-settings. Figure 1 below summarizes the phase of the KM cycle identified by Wiig (1993), Meyer and Zack (1996), Bukowitz and Williams (2003), McElroy (1999) and Award and Ghaziri (2004).

**Figure 1 Phases of the KM Cycle**

Table 1 provides a different view of the KM cycle phases identified by these researchers. Across the different phases identified, the ones similar in meaning are listed in a single row.

Based on these, we can conclude that KM is an ongoing process or cycle in an organization which starts with acquiring relevant knowledge resources and continues through their proper utilization. The first part is locating, acquiring and capturing existing knowledge that is relevant to the library and creating new knowledge. The acquired knowledge is organized using taxonomies, codification, indexing, filtering etc. The knowledge is refined and synthesized or transformed as per the needs of the library. The processed knowledge is preserved for permanent storage, and a retrieval mechanism is used for its easy access. Then knowledge is disseminated to the concerned people for sharing, applying, utilizing and using effectively. Finally, the KM process receives feedbacks from the knowledge users regarding the extent to which it satisfies their knowledge needs. Feedbacks ensure proper utilization of knowledge with necessary modification in the system. Finally, a call is made whether any part of the knowledge is expensive to keep and can be divested.

We can simplify Table 1 to get 8 unique phases that comprise the KM cycle:

1. Knowledge creation
2. Knowledge acquisition or sourcing
3. Knowledge compilation or capture
4. Knowledge organization, refinement, transformation and storage
5. Knowledge dissemination, transfer and access
6. Knowledge learning and application
7. Knowledge evaluation and value realization
8. Knowledge reuse or divesting

Dalkir (2011)’s integrated KM cycle covers 3 overarching phases: 1) knowledge capture and/or creation; 2) knowledge sharing and dissemination; and 3) knowledge acquisition and application (we revise this to ‘knowledge application and use’, as acquisition could be construed to be similar to knowledge capture). We adopt these phases of the integrated KM cycle (see Figure 2) for mapping to tools in this paper.

*Figure 2 A revised integrated KM cycle (adapted from Dalkir, 2011)*

*Type of knowledge applicable to libraries*
White (2004) sees KM as crucial to providing dynamic and effective services to library users of the 21st century. Two types of knowledge would be of interest to libraries – tacit and explicit. While explicit knowledge is formal, codified and systematic (like books that libraries have always dealt with; and other documents produced within the library), tacit knowledge is personal, experience-based knowledge held by people (Nonaka, 1991) – librarians and library staff, administrators and users.

1. Knowledge capture and/or creation: In Figure 2 above, in the first phase, tacit knowledge is identified or captured, explicit knowledge is organized or coded, or new knowledge is created. Knowledge creation is typically the outcome of an interactive process that will involve a number of individuals who are brought together in a project team or some other collaborative arrangement (Newell et al., 2002) such as networking with other libraries, attending library events (workshop, seminar, conferences) and connecting with online communities (Shanhong, 2000). That is why, the knowledge of library operations, library users and their needs, library collection, library facilities and technological knowledge needs to be put together. As a result, new knowledge will be created which leads to the improvement and development of service to the users and functioning of the library. However, this diverse knowledge is rather dispersed across all the library sections and up the library hierarchy.

2. This dispersed knowledge captured or created across the library needs to be assessed, then shared and disseminated across the library (Second phase in Figure 2).
3. Knowledge is then contextualized in each department of the library or to each library employee or user, in order to be understood and used (third phase in Figure 2). This stage then feeds back into the first one in order to update the knowledge (Dalkir, 2011).

Integrated Library Systems, while prevalent for a long time, are largely controlled by vendors, and often inadequate due to the growth of electronic and digital resources (Wang and Dawes, 2012), changed expectations regarding interfaces (Andrew, 2009), changing user demand (Breeding, 2006), as well as transformation of libraries in knowledge-based society to capture the range of knowledge needs that different areas of the area have. Thus, along with an integrated library system or a library automation system, libraries will need to supplement and include other technology tools that can capture their knowledge needs adequately.

We use the revised integrated KM cycle adapted from Dalkir (2011), as well as Davis (1989) and Roger (1995) theories on technology adoption/diffusion, as a theoretical lens in this study, and apply it to the context of knowledge management and KM-tool adoption in libraries.

**Methodology**

Klein and Myers (1999) provided a set of principles for conducting and evaluating interpretive field studies in information systems. While the methodology adopted in this paper was largely theoretical, a few key underpinnings from Klein and Myers are applicable to this paper. First, a theoretical base was established from prior literature. Second, existing
tools and technologies applicable to KM were reviewed. Third, these tools and technologies were mapped to various phases of the KM cycle. While a particular tool could be applicable in different phases of the KM cycle, an attempt was made to find the phase that the tool was best matched for. Fourth, non-IT tools were included to make the cycle complete. Finally, the theoretical model adopted was extended to come up with key findings from the paper. The use of the theoretical model to understand specific tools and their usage follows the fundamental principle of the Hermeneutic Circle, as well as the principle of abstraction and generalization as per Klein and Myers (1999).

**KM Tools and technologies for KM application**

In the tables below, we review a wide-range of technology (IT-based) and non-technology tools and techniques currently in use in KM or across disciplines, that would be applicable to the three phases of the KM cycle identified in Figure 2. The choice of tools for each phase must be specific to the library or department implementing KM, and must be consistent with its goals and strategy. Of the tools listed, most of them are free or open source, while some are paid or have paid features. Also, when considering a free product, libraries need to consider the cost of maintenance and the degree of support provided, and look out for any hidden costs. In helping to identify the tools and the categories within them (both IT and non-IT based), Good (2012, 2013), Young (2010), Dalkir (2011), Leask et al. (2008) were important studies, supplemented by other websites and blogs. Many of the descriptions of the tools are taken from or adapted from these sources as well. Many of these tools and techniques represent those that have been successfully adopted across organizations in their KM initiatives, as well as new possibilities brought about by technological advancements.
The six tables below are classified into the 3 phases of the integrated KM cycle of Figure 2. Each phase has 2 tables – one for non-IT-based tools, and the other for IT or technology based tools. The 3 tables on non-IT-based tools list the tool or method, what it does and how it applies to KM in libraries. The 3 tables on IT-based tables list the overarching technology category, what it does, examples of current tools in that category, as well as how those apply to KM in libraries. While specific examples of tools would evolve and change with time, the technology categories and non-IT-based tools or methods are expected to remain relevant for years to come. In each table, the tool categories or methods are listed in alphabetical order, and not in any particular importance or hierarchy.

**Cycle 1: Creation and Capture**

Table 2 and Table 3 include the non-IT and IT-based tools for capturing tacit and explicit knowledge or creating new knowledge in libraries. In the rightmost column of the two tables, we refine the category of ‘knowledge capture and/or creation’ further to knowledge codification, capture, creation, acquisition, sourcing, compilation or organization (terms used in Figure 1 and Table 1) to describe the application of each tool more precisely.

<td>Co-browsing; Screen sharing; Remote support</td>
<td>2 or more people browsing the web at the same time, helping another person situated remotely by accessing his/her screen</td>
<td>Firefly, GoInstant, LiveLook, Skype screen sharing, GoToMeeting, TeamViewer, Join.me, Netviewer, Twiddla</td>
<td>Acquisition or sourcing: E.g. Join.me is used by librarians to help patrons resolve their password and login issues, to demonstrate search strategies, or to problems downloading pdfs.</td>
</tr>
<tr>
<td>Collaborative visual reviewing</td>
<td>Instead of emailing different versions of a document back and forth, team members can visually review documents, and all comment on a single read-only copy online.</td>
<td>Annotate, Diigo, Uptogo, ConceptShare, Creately, Review Studio (former Cozimo), Notable, GroupZap, Google Drive, PDF-XChange Viewer/Editor (annotate PDFs)</td>
<td>Compilation or capture: E.g. Diigo helps in research, sharing and collaboration in many library activities.</td>
</tr>
<tr>
<td>Collaborative writing</td>
<td>Projects where written works are created by multiple people together (collaboratively) rather than individually.</td>
<td>Mixedlnk, Wridea, Editorialy, Draft, Google Docs/Drive</td>
<td>Creation: Help increase efficiency in creating storing, sharing document, bookmarks and citations. E.g. Google Docs/Drive can help library staff collaborate.</td>
</tr>
<tr>
<td>Document sharing - wikis</td>
<td>Helps to create and share work online and access documents from anywhere.</td>
<td>Wikis, Pbwiki, Wikispaces, Google Docs/Drive, Scribd, Issuu, Docstoc, MS SharePoint, Typewith.me</td>
<td>Creation: Wikis can be used by library staff to archive documents, and have places where multiple employees could upload/update.</td>
</tr>
<tr>
<td>Knowledge community / profile capturing</td>
<td>Websites for profiling based on expertise, and/or answering questions posed by visitors</td>
<td>Quora, K-comm.tk (Agarwal and Poo, 2008; Lek, Poo and Agarwal, 2009), Yahoo Answers, Wiki Answers</td>
<td>Capture: E.g. K-Comm helps capture the tacit knowledge held by individual library employees in various domains – from the sublime to the mundane. Helps provide a sense of community where everyone is an expert.</td>
</tr>
<tr>
<td>Mindmapping and diagramming</td>
<td>A diagram used to visually outline information.</td>
<td>Freemind, The Brain, Mind42, XMind, Webspiration, Bubbl, Mindmeister, Mindjet, MS Visio</td>
<td>Capture: Useful for libraries to developing maps that chart information, thought processes, library’s maps, contact information, meeting notes, project planning, SWOT analysis and future plans.</td>
</tr>
</tbody>
</table>
Social content

Helps the internet community tag content in websites, share metadata, and organize web links.

Del.icio.us, Blog, RSS, Tagging (Folksonomy), Diigo, Diigo, StumbleUpon

Acquisition or sourcing, and organization:
E.g. Delicious can help find other librarians/folks interested in the same knowledge field, libraries and discover their library-related links (add www.ala.org as one of your links, then find other people who are ALA fans).

Video recording

Useful for recording and editing video sessions of interviews, talks and presentations.

Video camera, Tripod, Video editing (Pinnacle Studio, Adobe Premiere Elements, Lightworks)

Capture: Libraries can record interviews of employees that are leaving, as well as talks and sessions held.

White boarding

Placement of shared files on an on-screen shared notebook or whiteboard.

Skrbl, Vyew, CoSketch Groupboard, Conceptboard

Creation: With collaborative features such as white boarding, desktop sharing, recording and video, e.g. Groupboard can be used to teach remote library members basic Internet and computer skills, while engaging participants with interactive lessons.

**Cycle 2: Sharing and Dissemination**

Table 4 and Table 5 include the non-IT and IT-based tools for knowledge sharing, transfer, access and dissemination across the library.

to develop yellow pages or an expertise location system.

**Social Network Analysis (SNA) / Sociograms**
Organizational networks and sociograms help map the flow of knowledge in an organization.

Using SNA, libraries can map relationships between people to identify knowledge flows: Who do people seek information and knowledge from? Who do they share their knowledge with?

**Storytelling**
Conveying events in words, images and sounds, often by improvisation or embellishment; useful for sharing experiential and tacit knowledge.

Libraries can use structured sessions to elicit stories of experience, and share knowledge of lessons learned and best practices pertaining to specific tasks or scenarios.

<p>| <strong>Table 5 Technology tools that best facilitate knowledge sharing and dissemination</strong> |
|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| <strong>Technology category</strong> | <strong>What it does</strong> | <strong>Tool name</strong> | <strong>Application for KM in Libraries</strong> |
| <strong>File sharing</strong> | Distributing or providing access to information stored digitally as files. | Dropbox, Skydox, clip2net, MediaFire, 4shared, Google Drive, SkyDrive, box.com | E.g. Libraries could use Dropbox or Google Drive to organize and share files pertaining to meetings or committee work. They could also assign different file permissions and make folders transparent outside a committee. |
| <strong>Group communication / private social network for the organization</strong> | A software platform that implements some form of group communication; teams can connect online. | Yammer, Socialcast, Teambox, Hipchat, Chatter, Socialcast, Everyme, Nextt, Ning, Groupsite, Meetup | E.g. Socialcast or Ning helps library teams (even when dispersed geographically) to interact socially (less formal than email) by making knowledge and updates accessible to their peers through a news feed. They can also build their own communities. |
| <strong>Instant Messaging / Chat</strong> | Real-time text transmission over the Internet. | Adium, Pidgin, Meebo, Yahoo, Windows Live, eBuddy, Google Talk, Trillian, Digsby, Nimbuzz; Todaysmeet (backchanneling) | E.g. Many libraries are using Meebo as a KM tool for reference services (Ou, Leung and Davison, 2011). |
| <strong>Intranet / Portal</strong> | An internal computer network to share information, operational systems, or computing services within an organization. | Igloo, Interact-Intranet, Moxie software, Podio, X-Wiki | Mphidi (2004) lists intranet among the most effective KM tools for libraries. Igloo, e.g., is a modern intranet that helps bring together content and conversation. |
| <strong>Large audience webinars – 100+ participants</strong> | A web-based seminar, lecture, presentation or workshop given over | GatherPlace, Adobe Connect, GoToWebinar, OmNovia, BigMarker | E.g. GoToWebinar can be used by librarians to disseminate best practices, or to update their skills by participating in webinars offered by others without leaving their work desks. |</p>

Cognitive Styles and Myers-Briggs Type Indicator (MBTI)  
Personality assessment test for employees to find out their personality type. Individual personalities affect the way people acquire and apply knowledge.  
Library staff can understand and better predict their personal preferences and behavior when accessing and using information.

Knowledge audit  
Understanding the knowledge environment of an organization or project to identify and deal with knowledge gaps.  
For continuous improvement, libraries need to understand the gap in their desired and existing knowledge.

Personalization and Profiling  
Using continually-adjusted user profiles to match content or services to individuals.  
Rather than one-size-fits-all library websites, users can be provided with personalization and profiling options.

Taxonomy  
Helps organize information, documents, and libraries in a consistent manner.  
Many libraries organize their knowledge assets using taxonomies to aid in effective navigation and retrieval.

Learning Reviews  
Used by a project team to aid team and individual learning during the work process.  
Team members working on library projects can continuously learn while carrying out the project.

Findings and Discussion

We have looked at tools and techniques for knowledge creation/capture, sharing/dissemination, and application/use – both technology-based solutions, as well as those that don’t necessarily rely on technology.

A few findings emerge:

1) It was found that there is no single set of tools that would be applicable to everyone or across libraries. Depending on technology adoption (Davis, 1989) and diffusion (Rogers, 1995), and individual personalities, people will use the information created, captured or shared differently. Tools such as MBTI (see Table 6) help individuals assess their own behaviour when accessing and using information.

2) Also, technology is just an enabler for KM. Only technology tools are not enough. A combination of physical environment and technology-enabled tools is necessary. For each phase of the KM cycle, we have provided a comprehensive summary of both technology and non-technology based tools.

3) Technology changes rapidly. While specific examples of tools would change over time, the broader technology categories, as well as the non-IT tools will remain relevant for many years.

4) Even among the technology tools listed, the ways to access them are changing. More and more of the tools will be used in mobile and tablet environments (Apple iOS, Google Android or Windows-based devices). We’d recommend librarians to pick tools that have mobile support, as they are more likely to be adopted and used in different ways.
5) Some tools are applicable to more than one phase of the KM cycle. Therefore, we choose the KM cycle phase that a particular tool would be best suited for.

6) We recommend librarians to pick 1-3 technology tools from each phase. The more tools that a library adopts, more would be the learning required for all employees. Additional support would also be needed. Therefore, a smaller number is recommended – whether this number is 1, 2, 3 or 4 will depend on individual library needs. This is because, tools, after all, are only enablers. The library would not want its employees to get mired in the learning curve of too many tools. To arrive at chosen tools, the library needs to survey its employees to ascertain their comfort level, preferences and the tools they might already be using.

7) Libraries will need to decide between free versus paid tools. Free or open source does not mean free. Libraries need to consider maintenance and training costs. After that, they would need to decide (based on budgets or human resources) whether they would go with proprietary (paid; supported by other companies) or free, open-source tools, where in-house manpower will have greater role.

More generally, the results of this study reinforce the recently accumulated evidence (Tyndale, 2002; Ruggles 1997, 1997b) that KM cycle and its tools can be applied in libraries. Findings of this study contribute to fill the gap existing in the literature by bringing together a comprehensive listing of tools and their possible application in libraries in a single paper. To summarize the findings, we present below a model for KM tools and their adoption in libraries.
The figure captures the key features of the integrated knowledge cycle model by Dalkir (2011). The tools for knowledge capture and/or creation (Table 2 and Table 3), the tools for knowledge sharing and transfer (Table 4 and Table 5), and the tools for knowledge application and use (Table 6 and Table 7) form the key pieces of the model. Individuals’ perceived usefulness and perceived ease of use of these tools (as per the TAM Model - Davis, 1989) will play a major role whether particular tools are adopted/used and successful, or not. Also, people who self-identify as innovators and early adopters (as per the Diffusion of Innovation theory - Rogers, 1995) are more likely to adopt changes easily, and should be part of the pilot program when adopting KM and KM tools in libraries. A librarian or a team assesses and transfers the captured or created knowledge, contextualizes it to one’s unique needs, and
updates it to form a continuous knowledge cycle, supported by technology. All of this must happen to support the wider organizational functions of the library such as circulation, reference, inter-library loan, customer service, etc., and help enhance its larger goals such as service, survival, growth, innovation and satisfaction.

**Concluding remarks, limitations and future work**

The proposed model for KM tools and their adoption in libraries should help further research in this area. The 6 tables and this model should help guide the practical implementation of KM in libraries.

The limitations of the study are the following. First, technology tools will keep changing. Therefore, individual examples listed, while applicable for the next 2-5 years, might change in the longer term, and will need to be supplemented with newer developments. Second, the directories of tools, as well as the proposed model, will need to be tested against actual adoption and use by librarians. The theoretical considerations presented in this article are not tested but rather based on conceptualization. Thus, while we expect the paper to be highly useful, it must withstand the test against actual intention to use, and usage.

In a future work, we will examine how integrated library systems need to evolve to take advantage of KM, and also gather qualitative and quantitative data to test the model.

**Acknowledgements**

When teaching Knowledge Management in Fall 2012, the first author provided a long list of tools and created an assignment whereby LIS students had to pick any one tool, learn the tool over a few weeks, create a tutorial based on it, and identify its relationship with the KM
cycle. In another course LIS 488 Technology for Information Professionals (across a few semesters), students had to learn technology tools and create tutorials as well. Some of the student-created technology tutorials can be seen at http://mytechtutorials.wordpress.com/. The authors are grateful to these students from Simmons College who indirectly provided an impetus for this article.
